Abstract

BerSi Chem is a geological software which will sampling and registration of field samples on personal computers. These samples will be registred on server database with which should have installed speciall tools for recieving data of Global Positioning System. BerSi Chem data this data will be stored on the Microsoft Access database which is readable from diferently devices for data manipulation, Mobile Phone or everything else which can be used on the field study.

After saving the data then automatically the coordinates received it will be placed on geological or geochemical map of the region or area of research. This software is ready for use and for geochemical projects that are being made today. Also we can do the programming of samples and coordinates where then we can see samples taken and the remaining samples to be performed and other information very important for geochemical sampling and geochemical field surveys.
